Psychoeducational materials for groups of patients

The objective of this work is to describe a strategy to improve tobacco control in hospital mental healthcare services of Catalonia.

## Methods

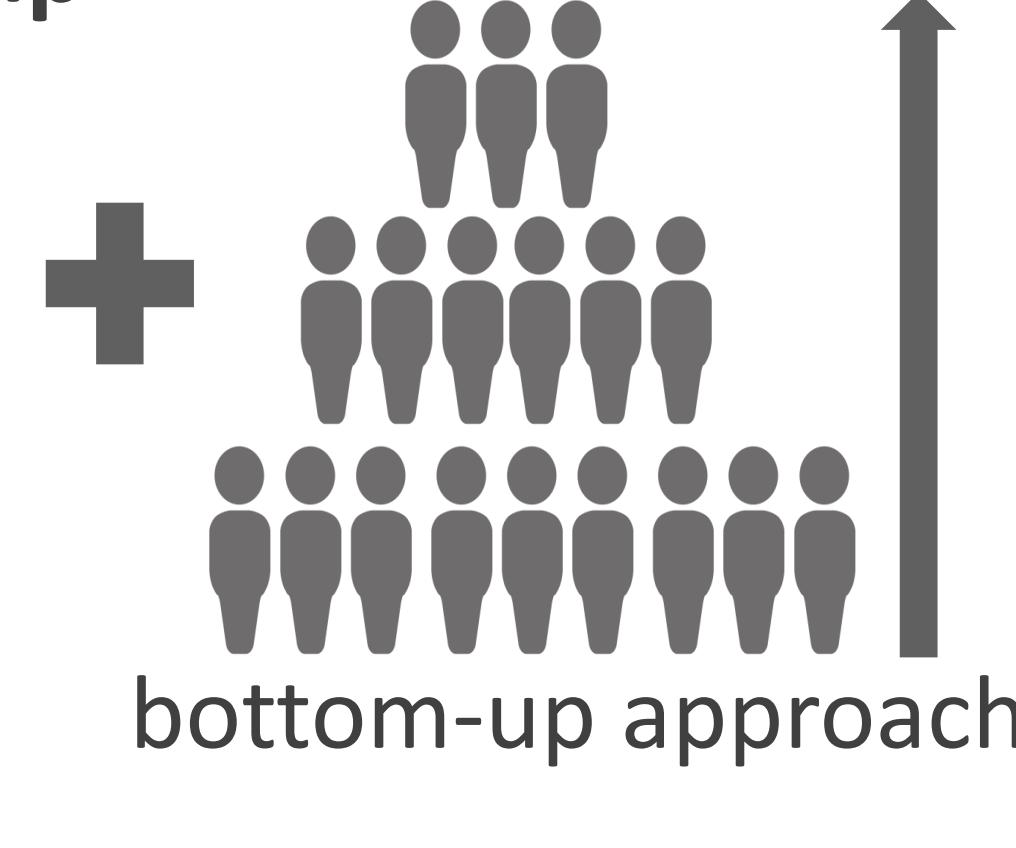

**2007: The Catalan Network of Smoke-free Hospitals launched a nationwide strategy in Catalonia.**

Based on Rogers' Theory of the Diffusion of Innovations.

### Creation of a working group

#### - the early adopters -

- Supported by the Catalan Ministry of Health
- Intended to influence the entire country of Catalonia (7.6 million inhabitants).

- To analyze the situation
- Decide priorities
- Joint decision making
- Joint actions
- Dissemination of results

## Results

A working group of 30 professionals from 20 institutions has been created:

13 psychologists  
10 psychiatrists  
7 nurses

The group comprises 70.8% (n=17) of all Catalan hospitals with acute mental health inpatient units (n=24).

Tobacco control has improved in different areas through various strategies such as:

### Training professionals

- Training on smoking cessation interventions (face to face / on-line / training the trainers programme).
- Producing and disseminating materials and guides.

### Programmes

- Programmes for post-discharge smoking cessation treatment with free medication (PDT-sm)

### Communication

- Organizing seminars every 2 years
- Sharing experiences between hospitals
- Scientific articles
- Communications in congresses

## Conclusions

- This initiative has improved tobacco control in these settings, however, some areas of tobacco control within mental health services still require significant development.
- This new scenario could enhance the quality of life and reduce morbidity and mortality of mental health patients.
